

Sandeep's Interview Mistakes and Hardly Learnt Lessons

1. **Low Confidence** in answering the questions which are known to me. Be confident. Don't use words: **May be..., I think., Putting confused face... etc.,**
2. **Keep the poker face**, don't let the interviewer know that you are not confident.
3. Using One-Word Substitutions instead of explaining the internal working of the concept.

Example: Don't use the word "Method Overloading" only, Explain the concept along with the word. Learn how to explain the concept instead of bounding them inside one word.
4. **Complete** the projects which you have started, Constantly and incrementally push the code to them. **Deploy** the completed projects. Give the Deployed Links of Web applications, make sure that the interviewer can access them and open them.
5. Answer the questions very confidently, even if you don't know the answer. Try to talk instead of being silent.
6. Practice answering the coding concepts, theoretically. You must know how to express the answer in words, to make the interviewer understand that you really know the answer.
7. Prepare example codes for every concept beforehand. Don't try to cook up the examples in the middle of interview.
